

Challenges of current AI models (Q1/2023)

Incorrect answers:

So far, the leading AI models like ChatGPT have used data previously fed in by the developers.

Since these are millions of different sources, they may be out of date and contain errors, so the AI's answers may also be wrong.

Missing sources:

Texts and passages also consist of different primary data, so that no direct source information is possible. This has already caused problems, especially in schools and universities.

Formation of stereotypes:

The company OpenAI has already done a lot to avoid stereotypes, but they still occur because the AI forms a cross-section and can only formulate answers at all through certain affiliations.

So there are still racist statements and historically shaped but outdated images of the enemy.

Copyright Issues:

Lately, there have been repeated copyright claims as the creators, writers and artists have not given permission to use their works, which are now used to inform and guide the AI.

The legal situation here is still unclear.
