

What is the Uniswap Token (UNI) ?

Uniswap is a decentralized crypto exchange based on the Ethereum Blockchain. It enables direct, fast and automated trading without a middleman.

The Uniswap exchange has issued its own token, as you also know from Binance, for example, who issued the BNB token.

The token is called Uni and is used for the administration and governance of the Uniswap protocol and ecosystem.

In addition, you can provide the token for liquidity pools to earn money passively.

What does the future hold for university?

Decentralization will play a major role in the future, and Web3 is focusing precisely on this. Uniswap stands out from all the central crypto exchanges like Coinbase, Binance and Crypto.com. With central exchanges, we give the cryptocurrencies into someone else's hands.

With the decentralized approach, Uniswap is independent of large institutions.

Uniswap is leading the way as an exchange and also focuses on simplicity and top user experience. That alone can lead to a breakthrough.

The UNI token will also benefit from this.
