

## **Building your crypto portfolio**

An important rule when investing in cryptocurrencies is risk management and diversification.

We show you an example of how you could spread your risk.

In this example, we focus on the top 10 cryptocurrencies plus a small portion of trend coins.

This way you spread your risk and invest in projects with large transaction volumes.

(Not for voice over just as a hint - now the graphic can gradually fade in)

50 percent Investment in Bitcoin, by far the largest cryptocurrency.

Invest 20 percent of the portfolio in Ethereum, the second largest cryptocurrency.

20 percent Investment in altcoins from the top 10 largest cryptocurrencies

Buy trend coins for 10 percent of your portfolio that just have good news in the press. Here the chance of short-term price gains is high.

This portfolio split is an example. How you distribute your portfolio depends on your interests and your risk profile. Before you decide on a coin to invest in, take a look at the project behind it. You can read this for the top 20 coins in the “Coins” course as a summary.

You should also regularly review your portfolio allocation and strategy.
