

Artificial Intelligence: Bard

Bard is an artificial intelligence from Google and is considered a competitor for ChatGPT.

The language model was trained using the Internet, has been in development since 2017 and is currently in closed beta (as of Q1/2023).

Here, too, the focus is on the dialog application, but what is special is the announced conversation with Google search and the Internet:

As a result, the AI learns in real time through queries, can download current information and is therefore always up to date, according to the developer.

Consumers can then use the bot to quickly find answers to their questions and execute commands just like ChatGPT, which is as of 2021 and currently has a limited amount of data available.
