

Definition metaverse

The metaverse or also called metaverse is a portmanteau of the prefix "meta" and universe. What is meant is a digital interactive space, which can be expanded into a world in perspective.

For example, users can create avatars, similar to game characters in computer games, except that you usually create them in your own image.

With these you can then move around the Metaverse, meet others, talk, play, trade and even go shopping.

However, the Metaverse is not a parallel universe to the real world, everything is one.

With the help of virtual reality headsets, you leave the visible area of the real environment and switch to the virtual one.

The exception is augmented reality gadgets, which combine both worlds.

Various tech companies have been improving the user experience for several years with various devices, so that in the best case it feels real.

The virtual objects and opportunities give you a benefit, for example to work more effectively and efficiently or to experience things that are denied to you in the real world.

Thus, the Metaverse should unite virtual 3-D spaces and offer similar customizations as the real world allows one.
