Scaling up your business - development of dApps (decentralized applications) and platforms on the web3

Web3 stands for decentralization and platforms. An increasingly popular type of company to start up are companies that build decentralized applications (dApps) and platforms.

What can this look like in concrete terms:

1. Development of decentralized apps
Entire platforms can be designed and automated with the help of dApps.

2. NFT Platforms
NFTs is one of the future markets. Here it can make sense to develop further platforms

3. Crypto Platforms
Just as there are many platforms in the banking space, this is also an area that could become interesting for crypto. For example, you could build a platform for comparing crypto staking, comparing different exchanges, or merging stocks and crypto portfolios. There are countless possibilities here

4. Own Metaverse
You can create your own Metaverse and then monetize it. See Metaverse of Sandbox or Decentraland.

5. Smart Contract Platforms
Bring companies to the Web3 with smart contract platforms and help to create smart contracts.
